(54) PROJECTION TYPE LIQUID CRYSTAL DISPLAY DEVICE

(57)Abstract:

PURPOSE: To provide a miniaturized projection type liquid crystal display device which is obtained by preventing a light source or an optical system from being large and complicated and which suppresses the irregularity of luminance or chromaticity in a picture display area and realized high-definition picture display.

CONSTITUTION: After from the light source 1 is split into two first and second luminous fluxes whose polarizing directions are mutually vertical like a P wave and an S wave, the polarizing directions of two luminous fluxes are adjusted in an identical direction. Thus, the utilizing efficiency of the light from the light source can be enhanced and the optical system is prevented from being large and complicated. Besides, since the chromaticity and the intensity of two luminous fluxes are almost identically adjusted by a correction element 13, the irregularity of the luminance and the chromaticity in the picture display area can be suppressed and the high-definition picture display is

realized.
